Pipe design Vortex Flowmeter

1. Brief Introduction

Fischer&Porter Corporation has the most advanced vortex flowmeter in the world. It may carry out the flow measuring, detecting and controlling for various liquids, gases, high/low temperature superheated steam and saturated steam. It is widely used in the industry department, municipal construction and environmental protection engineering, such as petroleum, chemical industry, metallurgy, electric power, paper making, drug making, food and so on.

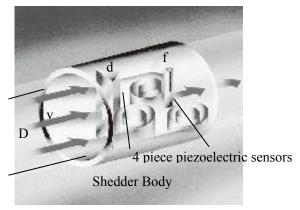

2. Characteristics

- Shock resistance type: the vortex flowmeter of Fischer & Porter Corporation adopts 4- piece piezoelectric crystals for measuring. Two of them are used to detect the flow of fluid. The other two are used to detect the vibration signal of pipe. 4-piece piezoelectric crystals adopt parallel connection mode to counteract the vibration signal detected by piezoelectric crystal detecting flow signal, thus the influence of external vibration on detecting flow is eliminated fundamentally.
- Temperature and pressure compensation: VT/VR transducer may receive temperature sensor PT100 signal directly ,temperature compensation ,output 4-20mA current signal; Or receive temperature sensor PT100 signal and pressure converter 4-20mA signal, temperature and pressure compensation, output RS485 signal, displays the fluid flow after temperature and pressure compensation.
- Explosion proof design: Exia II CT6 Exd II CT6
- Intelligent type: The meter parameters and meter range may be changed by three manual buttons or manual controller to modify instrument parameters

and range on site.

- Output mode: 4-20mA current signal output, pulse signal and RS485 port.
- Display mode: LCD multi-function screen can display the frequency, instantaneous flow and accumulated flow and so on, the type of temperature and pressure compensation can also display temperature, pressure, density, mass flow and so on.
- Communication mode: HART-communication protocol RS485 Modbus port

3. Priniple of Operation

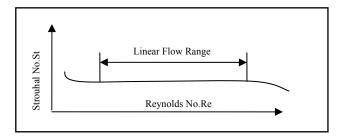

The operation of the Vortex Flowmeter is based on the Karman Vortex Street principle. Vortices are formed alternately on both of its sides as a fluid flows around the shedder body. The flow causes these vortices to be shed forming a vortex street (Karman Vortex Street).

The frequency \mathbf{f} of the vortex shedding in proportional to the flow velocity \mathbf{v} and inversely proportional to the width of the shedder body \mathbf{d} :

 $f = St \cdot v/d$

St, the Strouhal Number, a dimensionless number, defines the quality of the vortex flowrate measurements.

(See the formula and chart)

As a result, the vortex shedding frequency to be evaluated, is a function only of the flow velocity and is independent of the fluid density and viscosity.

6. Selection of Size

The measuring ranges of vortex flometerers with different calculated. The upper limit flow of the vortex calibres are different. Even if it is the flowmeter with the flowmeter is not generally influenced by the same caliber, as it is used for different mediums, its temperature and pressure of medium. The lower limit measuring range is also different. The actual usable flow measurement range is determined through calculation. Fischer&Porter Corporation has the advanced lectotype flow range of the vortex flowmeter is to determine the software. The user may also carries out the optimum actual usable lower limit flow. The methods are as selection by use of the software of the corporation.

6.1 Determination of flow range of gas

6.1.1 Flow range of gas under reference condition

Reference condition (namely calibration condition: the medium is the air at normal temperature and in normal pressure, $t_0=20^{\circ}\text{C}$, $p_0=0.1\text{MPa}$ (absolute pressure), $\rho_0=1.2$ kg/m³), for the flow range of gas under such condition fee the flow table 5.2.

6.1.2 The gas operating condition flow range under actual use condition

As the measured medium is not the normal temperature and pressure air, the actual measured flow range in operation condition needs to be calculated. The upper limit flow of the vortex flowmeter is not generally influenced by the temperature and pressure of medium. The lower limit flow depends on the operating condition density of medium. Therefore, determination of the actual flow range of the vortex flowmeter is to determine the actual usable lower limit flow. The methods are as follows:

The first step: calculate the volume flow rate of medium in operating condition $Q_V[m^3/h]$;

The second step: Look up the table 5.2 to determine the caliber of the meter according to the range Q_V;

The third step: calculate the actual usable lower limit flow according to the medium density and the measured lower limit value corresponding to the meter calibre;

according to the following formula:

$$Q_{V min} = Q_0 \times \sqrt{\rho 0/\rho}$$

In which:

Q_{V min}: actual usable lower limit flow [m³/h]

Q₀: the measured lower limit value corresponding to caliber [m³/h]

reference medium density $\rho_0=1.2$ kg/m³ ρ_0 :

medium operating condition density [kg/m³] ρ:

The fourth step: determine the upper limit flow range of the meter: the selection of gas flow upper limit takes the upper limit flow in flow table 5.2 as the standard. Generally, the flow velocity of gas should be smaller than 70m/s.

6.2 Determination of liquid flow range

6.2.1 The flow range of liquid under reference Condition

Reference condition (namely calibration condition: the medium is water, $t_0=20^{\circ}\text{C}$, $\rho_0=1000\text{kg/m}^3$) Under such condition, for the flow range of liquid see the flow

6.2.2 The liquid operating condition flow range under actual use condition

As the measured medium is not water, the actual measured flow range in operation condition needs to be flow depends on the operating condition density of medium. Therefore, the determination of the actual follows:

The first step: calculate the volume flow rate of medium in operating condition $Q_V[m^3/h]$;

The second step: Look up the table 5.1 to determine the calibre of the meter according to the range Q_V;

The third step: calculate the actual usable lower limit flow according to the medium density and the measured lower limit value corresponding to the meter calibre; according to the following formula:

$$Q_{V \min} = Q_O x \sqrt{\rho 0/\rho}$$

In which:

Q_{V min}: actual usable lower limit flow [m³/h]

measured lower limit value corresponding to Q_0 : caliber [m³/h]

reference medium density $\rho_0=1000 \text{kg/m}^3$ ρ_0 :

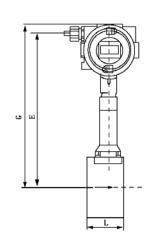

medium operating condition density [kg/m³]

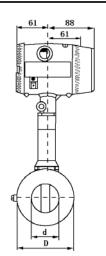

The fourth step: determine the upper limit flow range of the meter: the selection of liquid flow upper limit takes the upper limit flow in flow table 5.1 as the standard. Generally, the liquid velocity of gas should be smaller than 7m/s.

Note: The dimension D in the figure is equal to the inside diameter of the flange. It is determined according to corresponding flange standard.

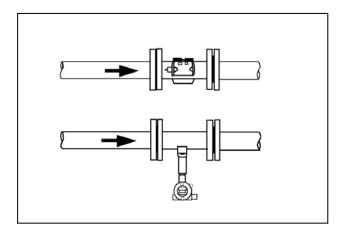

8. Installation of Meter

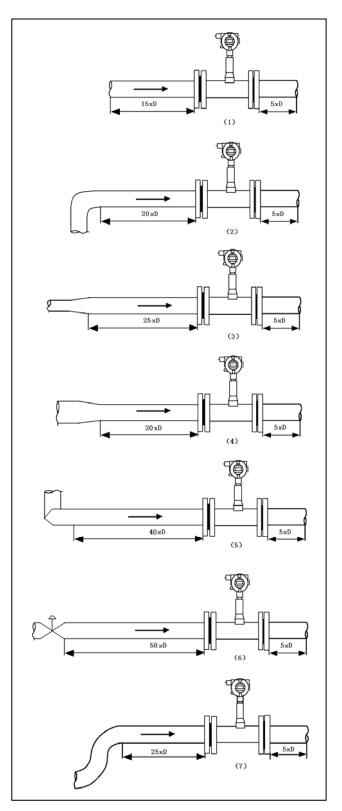

8.1 Installation instruction

In order to maintain the stable state as the medium enters the meter, the user should pay attention to the followings installation:

- ◆When metering liquids, the flowmeter primary is always completely filled with fluid and cannot drain.
- Mechanical vibrations are to be eliminated, using supports if required.
- ◆ Air bubbles in the pipe are to be eliminated, using air separator if required.
- ◆ For high fluid temperatures, the flowmeter primary should be installed so that the electronic assembly is mounted at the side or bottom of the flowmeter. The following figure shows the installations for High Fluid Temperatures >150°.

◆ Recommended in- and outlet sections

То

8.2 Installation of accessories

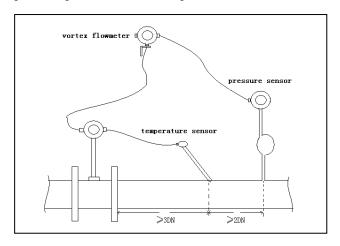

8.2.1 Temperature sensor

The circuit board of VT8000 type vortex flowmeter can receive the temperature sensor Pt 100 signal directly and realize the temperature compensation of the flow automatically. The temperature sensor adopts two-wire system Pt100, which is welded on the pipe directly to detect the medium temperature. The temperature sensor can also be provided by the manufacturer or is prepared by the user.

8.2.2 Pressure sensor

The circuit board of VT8000 type vortex flowmeter may receive 4-20mADC of the pressure converter signal (need to be independent power supply) directly and realize the temperature compensation of flow automatically. The pressure sensor can can be directly mounted on the pressure duct to inspect the fluid pressure. The pressure sensor may be provided by the manufacturer or is prepared by the user.

8.2.3 Installation of temperature and pressure sensor, pulse output/ RS485 modbus port

8.2.3.1 Installation of temperature sensor

The installation position of temperature sensor is shown as the above figure. Mounting hole with Φ 12 is opened at an angle of 60 degrees to the pipe where is more than or equal to 3DN from the downstream of vortex flowmeter on the pipe .100mm of the temperature sensor sheath is inserted into the hole, and then it is welded firmly.

8.2.3.2 Installation of pressure sensor

The installation position of pressure sensor is shown as the above figure. Mounting hole with Φ 12 is opened at an angle of 60 degrees to the pipe with where is more than or equal to 2DN from the downstream of vortex flowmeter on the pipe or use the pressure duct to connect the sensor with the pipe. If the heated fluid needs condensing processing, it is necessary to add sealingpot with spacer fluid in case of corrosion.

◆ Other accessories

Our company may provide other vortex flowmeter accessories: straight pipe section on the inlet/outlet, companion flange, bolt, nut, pad, etc.

9. Converter Parameters

9.1. Converters Technical Parameters

Converter buttons & display

The converter of VT8000 series vortex flowmeter completely adopts signal processing system (DSP technology), the digital circuit module can adapt to all pipe size and the conditions of gas and liquid fluid ,it can also adjust signal and deal with the specification; The wide LCD screen can display its fundamental configuration information which allow to beprogrammed and set casually, realizing multiple functions.

Based on spectral analysis with more frequency combfilter technology, based on the second float the uV levelsignal amplifiers and integrated design of power segregation, which effectively guarantee anti-interference ability and stability. Efficient power design makes powerdissipation extremely low, which greatly extend the battery life span.

Supply flexible input/output interface, can meet different complex needs of different users, the specific characteristics is as follow:

- ◆ The isolation electrical structure
- ◆ Excellent anti-interference ability
- Saturated and superheated steam temperature and pressure compensation
- ◆ IEEE754 double-precision loating-point alculations
- RamTron ferroelectric memory data stored permanently
- ◆ Compatible with HART6.0
- ◆ RS485 Modbus lightning protection interface

Flow Input Signal:

Sensor: 4 pieces piezoelectric sensors stress signals

Tempreture Input Signal(compensation signal):

Sensor: Pt resist Signal Stype: Pt100

Pressure Input Signal(compensation signal):

Sensor:Pressure converter Signal Stype: 4-20mADC

Output Signal:

a Three-wire system voltage pulse(VoL<0.8V,VoH>4.5V)

- b Two-wire system current pulse
- c Two-wire system current analog
- d HART@4-20mA
- e RS485 Modbus

Measure Accuracy:

Analog more over 0.2%,

Frequency more over 0.1% Calculation Precision:

IEEE754 double-precision floating-point calculations

Communication Function:

- a HART@4-20mA
- b RS485 Modbus lightning protection interface

Display Function:

Double-line LC-Display,can display accumulate flow, instantaneous flow, frequency flow, temperature.

Date Protection Function:

Adopting the latest RamTron ferroelectric memory date stored technology, the converter can record the operation result and the data set by the users at any time, in case of lost when power off.

Supply Power:

12 - 42 VDC(voltage pulse output)

16.5 - 42VDC(4-20mA@HART)

Power consumption:

1.3mA(battery supply Indicator style)

4-20mA(4-20mA@HART interface style)

60-80mA(RS485 Modbus interface style)

Work Environment:

Humidity: $-40 - 80^{\circ}$ C

Temperature:5 -95%RH

Electromagnetic Compatibility:

Accord with GB/T 17799.2-2003 "emc standards and industrial environment of the resistance to flexibility experiment".

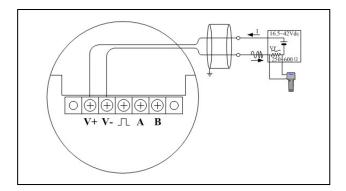

Weight:

About 100g

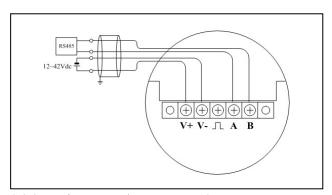

9.2. Electrical Connection Diagram

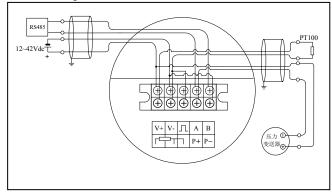

9.2.1 pulse output/4-20mA output/HART treaty

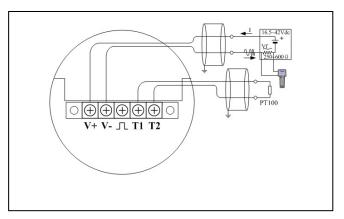

9.2.2 pulse output/RS485Modbus interface

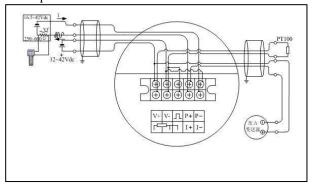

9.2.3 pulse output / temperature & pressure compensation / RS485Modbus interface

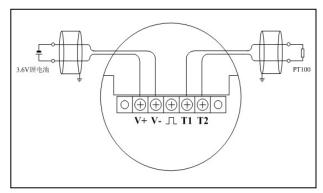

9.2.4 pulse output/temperature compensation/ 4-20mA output / HART treaty

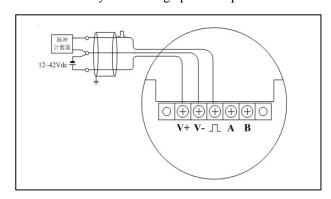

9.2.5 pulse output / temperature and pressure compensation

9.2.6 battery supply / pulse output / temperature compensation

9.2.7 three-wire system voltage pulse output

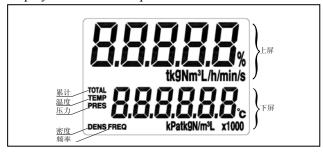

10. Converter Set Operating Instructions

V8 digital vortex flowmeter circuit module of the display has the function of scene shows and setting, its multifunctional LCD screen can display all kinds operation parameters on the site, there are three function keys with the module, which can install display content and operation parameters.

10.1. LCD Multi-function Screen

The multi-functional screen of V8 can display "frequency", "instantaneous flow", "accumulate flow" and so on, the style of temperature &pressure compensation can also display "temperature", "pressure", "density", "mass flow" and so on. LCD display screen is as the picture 10.1.

Picture 10.1 LCD display screen

There are three parts display content of LCD display ,it is divided into "up screen ", "down screen" and "content". The up screen is main screen, display principal variable namely instantaneous flow, the display content of the second line is the unit of the principal variable. The down screen is the multi-variable display screen., it can switching select "frequency value", "temperature value", "pressure value", "density value", "accumulate flow value", the bottom displays the unit of the down screen. The flow display is as the picture 10.2.

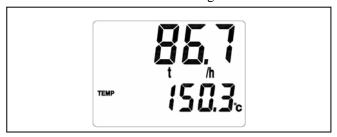

Picture 10.2 instantaneous flow and accumulate flow

The temperature &pressure compensation style of V8 can calculate and display the mass flow of the superheated and saturated vapor, it is as the picture of 10.3.

Picture 10.3 instantaneous flow and accumulate flow of the vapor 's mass flow

The temperature &pressure compensation style of V8can display "temperature", "pressure" and "density" and so on, Through the key choice switching to some page, it can keep displaying for 10 seconds, for example, when displaying temperature, the content of the screen is as the picture 10.4. Furthermore, the down screen can fixed display some content by setting function code, accumulate flow is the default setting.

Picture 10.4 temperature

The users can set cruise show function to change each parameters in turn automatically on the down screen.

10.2. Display data dimension

This section introduces the content of the screen shows corresponding dimension (units). Various parameters shown in table 10.2.1 content.

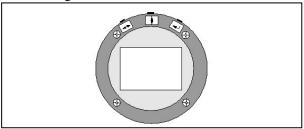

标题栏	单位
TOTAL	N m³, m³, L,kg 或
	t
TEMP	℃
PRES	MPa 或 kPa
FREQ	Hz
DENS	kg/m³

Chart10.2.1 display data dimension

The unit of flow quotient K is p/l, namely, how many pulses per litre.

10.3. The introduction of keys functions

Buttons located above the LCD is along the circumference distribution, in the circuit printing marks respectively: key, key, key, key. Three buttons has different functions and definition in normal operation state and setting state. Button arrangement shown as shown in figure 10.5.

Picture 10.5 keys

Press the

key to change the content of multi-functional dispay screen in normal state, press the

key can change the display content to the instantaneous flow, the

key does not work in normal state.

The definition of function when setting the state from left to right in turn is "left and right " key," up and down" key, "enter" key, V8 adopts three-key-combination to complete the settings of codes and numbers, the specific method of use will be in the next chapters of this manual ,which will be introduced in detail.

10.4. The show of accumulate flow

The accumulate flow can maximum plan to integer bit nine, three decimal places, the down screen is divided into two screens. When one of the screens is full, it will be divided into two automatically, then it can change the display through the key. The high bit screen displays according to 1000 times and lights up X1000 characters in the down screen. For example below 10.6

Picture 10.6 high bit part displays according to 1000 times

At present, it can change to the low bit part by pressing the ↔ key. As the picture 10.7

Picture 10.7 mantissa part

Then as seen, the accumulate flow is 569864.581kg.

10.5. Parameters setting

We should have some simple setting for the specific flowmeter on basis of the definition of function. Firstly, it needs ensure the style of the fluid and the output mode and so on. We call it code setting; Secondly should ensure the dimensions of the measure pipe, the flow range and the flow quotient and other constant, we callit number setting. The definition of function when setting the state from left to right in turn is "left and right" key, "up and down" key, "enter" key, V8 adopts three-key-combination to complete the settings of codes and numbers

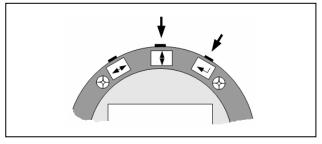

10.5.1. Setting ways

The settings of V8 is divided into code setting and number setting, the code setting used to set the functions of the flowmeter, such as the choice of the output style,temperature&pressure compensation style,into checkout status and so on.

;Number setting is used to set the constant of the setting systerm.

10.5.2. Code setting

In normal status, first press the key, meanwhile the key, then the flowmeter cone into code setting status, as shown in figure 10.8 shown.

Picture 10.8 in/exit code setting

The double-digit code is the parameter serial number on the screen,the below double-digit code stands for the current functional code of the parameter, meanwhile the setting bit flickers, as shown in figure 10.9 shown

Picture 10.9 the setting page of code setting

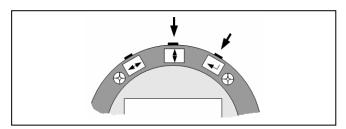

Showing code address 01 "tested fluid type" parameters setting, from the screen can see the functional code value of 01 address is 02, which says the current tested fluid is "liquid".

Exit code setting is the same as first to press the key, meanwhile press the key, then the flowmeter will write set parameters into the internal FLASH memory and exit the setting status, then into the normal operation status.

So by changing the under serial number of some parameters (codes address) function code can achieve the purpose of changing parameters Settings.

10.5.2, Number setting

Under normal status, first to press the □key, meanwhile to press the ⇔key, then the flowmeter comes into setting status, as shown in figure 10.10 shown.

Picture 10.10 in/exit number setting

The double-digit code is the parameter serial number on the screen, the below double-digit code stands for the corresponding specific value, meanwhile the setting bit flickers, as shown in figure 10.11 shown.

Picture 10.11 the setting page of number setting

Showing number address 001 " up the Pressure maximum P " parameters setting, from the screen can see the functional code value of 001 address is " 4.0000000", which indicates the maximum of the current tested pressure, namely, when the analog value is 20mA, the cooresponding value is 4.00MPa.

Now can use the \iff key to move the setting bit, use the \implies key to choose the number from $0 \sim 9$, use the \implies key to ensure and turn paging. The number settings then completed by operating repeatly.

Exit code setting is the same as first to press the \longrightarrow key, meanwhile press the \longleftrightarrow key, then the flowmeter will exit the setting status, then into the normal operation status.

10.5.4 . Setting project schedule

All of the Settings is to the register address of the codes and numbers setting, Table 10.5.1 and table 10.5.2 corresponding codes and numbers setting addresses and functions respectively.

List of 10.5.1 codes set address (meanwhile press numeric add keys and confirm button to enter and exit).

CODE ADDRESS	SIGNIFICANCE	FUNCTIONAL CODE	DESCRIPTION
01	Togted fluid style	01	Gas
01	Tested fluid style	02	Liquid
		00	Working volume flow
